While mental health professionals are well trained to identify and treat psychopathology, little is taught about how to look for strengths in patients that assist them in their coping and that, on their own and with our nurturance, can foster their recovery. The practicing subphase occurs from about six to ten months and up to eighteen months of age.

Kirsner concluded that these institutes stifled inquiry and relied upon a politicized received wisdom of truth. It is illegal to redistribute it in any form. In infants, behavior associated with attachment is primarily a process of proximity seeking to an identified attachment figure in situations of perceived distress or alarm, for the purpose of survival.
