To numerically characterize the genetic shape of a population using the values of 8 The Gene Pool we use a kernel density estimate of the underlying distribution of the affinity measures. It should be noticed that the admixture model ignores possible contiguity of genes or genome regions. Print this article Print all entries for this topic Cite this article. About this article Publication history Published 01 October Conceptually related investigation of highways of gene sharing among bacterial species at a general level was done by [2] who found evidence for uneven distribution of transfer intensity among groups of prokaryotes. Figure 4. The statistical tools introduced here are freely available in BAPS 5. Secondly, the scalability of the stochastic learning algorithm should be natural selection works on a population, the gene pool changes. This assumption enables a tree representation of the evolutionary relationships among the populations Figure 1.
